

MASTER CLONING LOG

Tropical Roots Maui | Cloning & Genetic Lineage Tracker | Print & Clipboard Ready

"Success is not measured by the height of the leaf, but by the strength of the hidden roots."

-- Kanehiwa

ENVIRONMENTAL MONITORING -- The Mana Zone

Target: 75-80 F | 80-90% Humidity | pH 5.5-6.0 | Soft Light (18/6)

DAY	TEMP (F)	HUMIDITY (%)	DOME STATUS	ACTION TAKEN (Mist / Vent / Burp)
Day 1			☐ Closed	Initial placement into dome
Day 3			☐ Closed	
Day 5			☐ 1/4 Vent	
Day 7			☐ 1/2 Vent	First visual check for root nubs
Day 10			☐ Full Vent	
Day 14			☐ Off	Hardening off complete

MASTER CLONING LOG -- CONTINUED

"The pen is as sharp as the blade. By recording the days of the root, you learn which Mother plant is most eager to share her spirit with the next generation."

-- Kanehiwa

IMPLEMENTATION TIPS

- **The Speed Factor:**
If one mother consistently roots in 6 days while another takes 12, that 6-day mother is your elite producer. Track it here and prove it.
- **Node Position:**
Mid-tier cuttings often root faster than top cuttings because they have a better balance of hormones and carbohydrates. Use this log to confirm.
- **Sterilize Between Cuts:** Wipe your blade with isopropyl between each cutting to prevent cross-contamination between clones.
